What Problems Does This App Solve?

1. **Advanced Workflows Without Coding** - Reusable Groovy Scripts allow even less skilled Jira admins to conjure advanced workflows.
2. **Cutting Overhead from Jira Admin** - Workflow PowerBox eliminates the need for adding all conditions, validators, and post functions manually, which is a very time-consuming work. Normally, every single transition has to be updated with conditions, validators and post functions manually. With Workflow PowerBox, you can pre-define a template instead and *then* work with it. It's particularly useful when you often use similar sets of transition elements.
3. **Editing Templates Edits Workflows** - If you edit a template, the changes will automatically propagate to all workflows using the template. No need to change it manually (and painstakingly).
4. **Templates within Templates** - You can put a template in a template. When you disable an embedded template, it is simply skipped from a workflow - a great solution for temporary changes (e.g. maintenance-related).
5. **Extending Workflow Capabilities** - Additional Conditions, Validators and Post-functions speak for themselves.
6. **Conditional Validation in Jira** - With our templates, you can, do conditional validation in workflow transitions and inversing conditions and validators result without scripting or coding. Now you can do advanced validation and "except-like" conditions.
