# Getting Started

## What is PULSE - Monitoring Tool for JIRA?

PULSE - Monitoring Tool for JIRA is a monitoring solution allowing you to get the statuses of your websites, servers and other devices (called *service*).

With this app, you can define a verification method for each service then monitor it and generate availability and performance reports. You can see in real-time which service or device is up & working and monitor it and create JIRA issues on failure automatically.
