

How Does This App Work?

PULSE - Monitoring Tool for JIRA plugin checks your status of network services at the selected interval automatically. You can monitor the status of services (using protocols such as HTTP(S), FTP, ICMP, IMAP(S), POP3, SMTP(S), SNMP, SSH) on a single page.

If a service failure (or degraded performance) is detected, you will be notified with a JIRA issue, and it will show in your reports and gadgets.

Service monitoring with JIRA has never been easier!
